DESCRIPTION OF MEDICAL USE

Hair loss, often caused by genetics, hormonal shifts, or aging, can affect both men and women—impacting self-esteem, confidence, and emotional well-being. This prescription-based treatment plan is designed to address hair thinning at the root cause while also supporting regrowth and long-term scalp health. The protocol combines a hormone-regulating oral medication to reduce the production of a compound that shrinks hair follicles, a topical scalp treatment that increases blood flow and reactivates dormant follicles, and a nutritional supplement that supports keratin production for stronger, thicker strands. This inside-out approach not only slows hair loss but helps stimulate new growth and improve hair texture over time. When used consistently, it can restore vitality to the scalp and help patients reclaim a healthier, fuller head of hair—with results that go beyond the mirror.

Disclaimer: Illinois Compounding Pharmacy, Inc. is a 503A licensed compounding pharmacy that customizes medications to meet unique patient and prescriber needs. The FDA allows compounding when commercial drugs are in shortage or the patient is required to take a compounded drug because they will benefit from it. Compounding a product because it is cheaper than a commercial product is not allowed. Our pharmacy does not compound copies of commercially available products unless allowed by the FDA (ie FDA shortage list, allergies, palatability, etc.
